1. CANDIDATE'S DECLARATION

I, Rajdeep Srivastava, do hereby declare that the internship report titled “**Staybnb – Airbnb Inspired Frontend Website**” has been completed by me to fulfil the requirements for the award of the degree of Bachelor of Technology in Computer Science and Engineering. The report presents the work carried out and the knowledge acquired during my internship as a **Web Developer Intern at Codec Technologies Pvt. Ltd.** The project involved the development of **Staybnb**, an Airbnb-inspired responsive frontend website, and provided practical experience in web development, HTML5, CSS3, responsive web design, Flexbox-based layouts, user interface development, webpage navigation, browser testing, debugging, and project deployment.

All references and sources used in the preparation of this report have been appropriately acknowledged. I affirm that this report represents my own work and has not been submitted to any other institute for any degree or diploma requirement. I shall be solely responsible for any kind of copyright violation in this regard.

Signature:

Student Name: Rajdeep Srivastava

Roll No. : 25SCS1003001106

2.ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone who supported and guided me throughout my internship program. This internship provided me with valuable practical exposure to **web development** and helped me understand how modern web technologies can be used to design and develop a real-world user interface. I am thankful to **Codec Technologies Pvt. Ltd.** for providing me with the opportunity to work as a **Web Developer Intern** and gain practical experience while working on the **Staybnb – Airbnb Inspired Frontend Website** project. I am grateful for the guidance and support provided during the internship, which helped me improve my understanding of **HTML5, CSS3, Flexbox, responsive web design, media queries, webpage navigation, UI design, asset management, embedded maps, browser testing, debugging, GitHub, and deployment using GitHub Pages**. Working on Staybnb helped me understand the different stages of frontend website development, from planning and designing to implementation, testing, and deployment.

I would also like to express my gratitude to the faculty members of the **School of Computer Science and Engineering, IILM University, Greater Noida**, for their academic guidance and support in preparing this internship report. Finally, I express my heartfelt gratitude to my **parents** for their constant encouragement, support, and blessings throughout my academic journey and internship. Their motivation has always encouraged me to learn new skills, overcome challenges, and give my best in every opportunity.

4.PROJECT DESCRIPTION

1.Introduction

Staybnb is a web-based accommodation and travel platform developed to provide users with a simple and visually appealing way to explore different places and accommodation options. While searching for a suitable place to stay, users generally need to consider factors such as location, available properties, pricing, property details, and travel preferences. Staybnb was developed to present these types of information through a clean, organized, and user-friendly web interface.

The main idea behind Staybnb is to provide users with an easy way to explore accommodation options according to their travel requirements. The website includes a search-oriented interface where users can enter information such as **location, check-in date, check-out date, and number of guests**. It also provides visually rich sections for displaying different destinations and accommodation options through **property and destination cards** containing images, names, descriptions, and pricing information. A dedicated property/details page is included to provide a more detailed presentation of a selected accommodation.

Another important aspect of the project is its focus on **responsive web design**. The website is designed to provide a consistent experience across different screen sizes, including desktop, tablet, and mobile devices. **CSS Flexbox and media queries** are used to arrange and adjust different sections according to the available screen width. This helps prevent common layout problems such as overlapping elements, excessive horizontal scrolling, and improperly sized content on smaller devices.

The project was developed using **HTML5 and CSS3** along with supporting web resources and tools. HTML5 was used to create the structure of the webpages, while CSS3 was used for styling, layouts, spacing, typography, cards, buttons, and responsive behaviour. The project also uses external resources such as **Font Awesome icons** and an embedded **Google Map** for supporting visual and location-related functionality. GitHub was used for maintaining the project repository, while **GitHub Pages** was used to publish the frontend as a live website.

The overall aim of Staybnb is to create a **simple, attractive, responsive, and user-friendly accommodation browsing interface** while providing practical experience in frontend web development. The project helped in understanding the complete frontend development process, including requirement analysis, webpage planning, HTML structure, CSS styling, responsive design, navigation, testing, debugging, version control, and deployment.

2. Organization Profile

The internship project was completed under the guidance and supervision of **CODEC TECHNOLOGIES**.

Organization Name: CODEC TECHNOLOGIES

Organization Address: 211B, Saki Vihar Road, West Chandivali IT Hub, Powai, Mumbai, MH 400076

Internship Role: Web Developer Intern

Internship Duration: 02/07/2026 to 02/08/2026

Department/Project Team: Web Development

The organization provided an environment for practical learning and helped in applying technical knowledge to a real-world **web development project**. During the internship, the project work focused on understanding requirements, planning the website structure, designing user-interface components, developing webpages using HTML and CSS, implementing responsive layouts, managing website assets, testing different screen sizes, debugging layout issues, and preparing the final project for deployment.

The internship provided practical exposure to **frontend web development practices** and helped in understanding how a website is planned, designed, developed, tested, and deployed. Working on the **Staybnb – Airbnb Inspired Frontend Website** provided an opportunity to apply concepts such as responsive design, Flexbox, media queries, webpage navigation, visual presentation, browser testing, GitHub repository management, and GitHub Pages deployment in a practical project environment.

3. Problem Statement

Finding a suitable place to stay can be difficult because information about **location, pricing, property details, facilities, and availability** is often spread across different platforms. Users may have to explore many options before finding accommodation that matches their destination, budget, travel dates, and number of guests.

Another challenge is comparing different properties. Users need to check **images, prices, locations, and property details** before making a choice. If this information is not presented clearly, the browsing process can become time-consuming and confusing.

Responsive design is also important because users access websites through different devices. A poorly designed layout may cause problems with navigation, search fields, images, cards, and buttons, especially on smaller screens.

Staybnb was developed to provide a simple and organized platform where users can enter their travel details, explore destinations, browse accommodation cards, view property details, and check location information through a map. The main objective is to make accommodation discovery **simple, visually appealing, responsive, and user-friendly**.

4. Project Objectives

The primary objective of **Staybnb** is to develop a user-friendly and responsive accommodation website that simplifies the process of exploring and viewing different places to stay.

The major objectives of the project are:

1. User-Friendly Interface

To design a simple and attractive interface that allows users to easily explore accommodation options.

2. Accommodation Discovery

To provide users with a platform where they can browse different destinations and property options.

3. Search and Booking Interface

To provide search fields for **location, check-in date, check-out date, and number of guests** to represent a basic booking workflow.

4. Property Information

To display important property information such as images, location, description, and pricing in an organized manner.

5. Responsive Design

To make the website responsive and accessible across **desktop, tablet, and mobile devices** using Flexbox and media queries.

6. Easy Navigation

To provide clear navigation between the homepage, travel section, and property details pages.

7. Visual Presentation

To use images, cards, icons, typography, spacing, and buttons to create an attractive and engaging user experience.

8. Location Support

To include a map-based element to help users understand the location of the selected accommodation.

9. Testing and Debugging

To test the website across different screen sizes and fix common layout, navigation, and styling issues.

10. Deployment

To publish the completed frontend project using **GitHub Pages** and maintain its source code through GitHub.

5.Scope of the Project

The scope of **Staybnb** covers the development of a responsive accommodation discovery website that allows users to explore destinations, view property information, and interact with a simple booking interface.

Accomadtion Discovery

Users can explore different travel destinations and accommodation options through organized property cards and sections. This provides the basic discovery functionality of the website.

Search and Booking Interface

The website provides fields for **location, check-in, check-out, and number of guests**. These elements create a simple and user-friendly interface for entering travel requirements.

Property Details

Individual property pages provide important information about accommodations, including images, descriptions, location details, and other relevant property information.

Destination Explanation

Staybnb includes multiple destination sections where users can browse popular locations and explore available accommodation-related content.

Responsive Design

The website is designed to work across **desktop, tablet, and mobile devices** using CSS Flexbox and media queries. The layout adjusts elements such as cards, navigation, forms, buttons, and images according to screen size.

Navigation

The project provides navigation between different sections and pages, including the homepage, travel-related content, and property detail pages, allowing users to explore the website easily.

Visual and UI Design

The project focuses on a clean and attractive user interface using **images, cards, icons, typography, spacing, buttons, and structured layouts** to improve the overall browsing experience.

Location and Map

Property location information is supported through an **embedded Google Map**, helping users understand the geographical location of the accommodation.

Testing and Debugging

The website is tested across different screen sizes and browsers to identify and fix issues related to layout, navigation, responsiveness, images, and styling.

Deployment

The project is maintained through **GitHub** and deployed using **GitHub Pages**, making the website accessible through the internet.

Future Scope

The project can be further expanded with features such as **real-time property availability, user authentication, database integration, online booking and payment, property reviews, advanced search and filtering, and a dedicated mobile application.**

6. Technologies and Tools Used

The **Staybnb** project uses a simple and practical web development stack focused on frontend development, responsive design, webpage navigation, and deployment.

HTML5

HTML5 is used to create the basic structure of the Staybnb website. It defines elements such as headers, navigation menus, search forms, destination sections, property information, buttons, images, and other webpage components.

CSS3

CSS3 is used to design and style the website. It controls colors, fonts, spacing, images, cards, buttons, layouts, and other visual elements to create a clean and attractive user interface.

FIREBOX

CSS Flexbox is used to arrange webpage elements in rows and columns. It helps create flexible layouts for navigation bars, search sections, destination cards, property information, and other components.

Responsive Design and Media Queries

Media queries are used to make the website responsive across different screen sizes. The layout automatically adjusts for **desktop, tablet, and mobile devices**, including changes to cards, navigation, forms, buttons, and images.

Font Awesome

Font Awesome is used to add icons to different parts of the website. Icons improve the visual appearance and make elements such as navigation and buttons easier to understand.

Google Map

An embedded Google Map is used to display the location of a property. This provides users with visual information about the geographical location of the accommodation.

GitHub

GitHub is used for storing and managing the project source code. It also helps maintain the project files and provides version-control support during development.

GitHub Pages

GitHub Pages is used to deploy the Staybnb website and make the frontend project accessible through the internet.

Web Browser and Developer Tools

Modern web browsers and their developer tools are used for testing, debugging, inspecting HTML/CSS elements, and checking the responsiveness of the website on different screen sizes.

The documented technology stack for Staybnb therefore includes HTML5, CSS3, Flexbox, Media Queries, Font Awesome, Google Maps, GitHub, and GitHub Pages.

7. System Architecture

The **Staybnb** system follows a simple frontend-oriented architecture in which the website is divided into structured pages, reusable interface sections, styling components, images, and navigation elements. The architecture focuses on maintaining a clean layout, easy navigation, responsive design, and proper organization of project files.

7.1 Presentation Layer

The presentation layer contains the user-facing interface of the Staybnb website. The main pages and sections include the **Home page, Travel section, Property Details page, Search and Booking interface, Destination cards, and Location Map**. These elements provide users with the primary interaction points for exploring destinations and accommodation information.

7.2 Webpage and Component Layer

The website uses structured HTML elements and reusable design patterns to maintain consistency across different sections. Major interface elements include:

- **Navigation Bar**
- **Search and Booking Form**
- **Destination Cards**
- **Property Cards**
- **Property Information Section**
- **Buttons and Icons**
- **Image Sections**
- **Google Map Section**

These elements help maintain a consistent visual structure and make the website easier to navigate and understand.

7.3 Styling and Responsive Layer

The styling layer is implemented using **CSS3, Flexbox, and Media Queries**. CSS controls the appearance and positioning of webpage elements, while Flexbox manages flexible layouts. Media queries adjust the design according to different screen sizes, ensuring that the website remains usable on **desktop, tablet, and mobile devices**.

7.4 Navigation and Deployment Layer

The navigation structure connects different pages of the Staybnb website, allowing users to move between the homepage, travel content, and property details. The complete project is maintained on **GitHub** and deployed through **GitHub Pages**, making the website available online.

8. Methodology

The development methodology used for **Staybnb** consisted of multiple stages, beginning with requirement analysis and planning and continuing through design, implementation, testing, debugging, deployment, and documentation.

8.1 Requirement Analysis

The first stage involved identifying the main requirements of the accommodation discovery website. Important requirements such as destination exploration, property information, search and booking interface, responsive design, navigation, and location support were identified.

The requirements were organized according to the expected user journey, beginning with entering travel details and exploring destinations and continuing through viewing property information and location details.

8.2 System Planning and UI Design

After identifying the requirements, the structure of the website was planned. The main webpages, navigation structure, search section, property sections, destination cards, and supporting elements were identified before implementation.

The user interface was designed with emphasis on **simplicity, visual appeal, easy navigation, responsiveness, and clear presentation of accommodation information.**

8.3 Frontend Development

HTML5 and CSS3 were used to implement the core frontend of the Staybnb website. HTML was used to create the webpage structure, while CSS was used for styling, layouts, spacing, typography, images, buttons, and other visual elements.

8.4 Layout and Component Development

The website was developed using structured and reusable design patterns to avoid unnecessary duplication. Common elements such as navigation, search forms, destination cards, property sections, buttons, and image sections were organized consistently across the website.

Flexbox was used to create flexible layouts and properly align different interface elements.

8.5 Navigation and Page Integration

The different webpages of Staybnb were connected through navigation links. Users can move between the **homepage, travel section, and property details page**, creating a simple and connected browsing experience.

8.6 Responsive Deployment

Media queries were implemented to ensure that the website adapts to different screen sizes. The layout of cards, navigation, forms, images, and buttons was adjusted for desktop, tablet, and mobile devices.

8.7 Testing and Debugging

After implementation, the website was tested at different screen sizes and in web browsers. Issues related to layout alignment, responsiveness, navigation, images, and styling were identified and corrected.

8.8 Deployment and Documentation

After successful testing, the project was uploaded to **GitHub** and deployed using **GitHub Pages**. The final stage involved documenting the development process, technologies used, project features, outcomes, and learning gained during the internship.

9.Expected Outcomes

The expected outcome of **Staybnb** is a simple, responsive, and user-friendly accommodation discovery website that makes it easier for users to explore destinations and view property information.

The project aims to achieve the following outcomes:

Improved Accommodation Discovery

Users can explore different destinations and browse accommodation options through organized property and destination sections.

Easy Travel Planning

The search interface allows users to enter important travel details such as **location, check-in date, check-out date, and number of guests**, providing a structured way to plan their stay.

Better Property Understanding

Property images, descriptions, location information, and other details help users understand an accommodation before making a decision.

Improved User Experience

A clean interface with organized cards, buttons, navigation elements, icons, and proper spacing makes the website easier and more convenient to use.

Responsive Accessibility

The responsive design ensures that the website works effectively on **desktop, tablet, and mobile devices**, providing a consistent browsing experience across different screen sizes.

Location Based Convenience

The embedded Google Map helps users understand the location of a property and provides additional geographical context while exploring accommodation options.

Easy Navigation

The connected webpages allow users to move smoothly between the homepage, travel content, and property details.

Online Availability

Deployment through GitHub Pages makes the Staybnb website accessible online and demonstrates the complete process from frontend development to deployment.

Expandable Platform

The project provides a foundation that can be expanded in the future with features such as **real-time availability, user accounts, reviews and ratings, advanced search and filtering, online booking and payment, database integration, and mobile application support.**

Overall, the expected result is a **responsive accommodation discovery platform** that combines destination exploration, property information, travel search, location support, and an attractive user interface in a single web application.

10. Certificates of Completion and Other Communication Mail Proof

The internship completion certificate issued by **Codec Technologies Pvt. Ltd.** confirms the successful completion of the internship as a **Web Developer Intern**. The internship was completed from **02 July 2026 to 02 August 2026**.

During the internship, the work focused on **frontend web development** and the development of the **Staybnb – Airbnb Inspired Frontend Website**. The project involved working with **HTML5, CSS3, Flexbox, responsive design, media queries, webpage navigation, embedded Google Maps, GitHub, and GitHub Pages**.

The internship provided practical experience in designing and developing responsive web interfaces, organizing webpage structures, implementing layouts and navigation, managing images and other assets, testing webpages on different screen sizes, debugging design and functionality issues, and deploying the completed project online. The completion certificate and relevant communication emails serve as proof of the successful completion of the internship and the work carried out during the internship period.

BIBLIOGRAPHY

The following resources were used as references during the development and documentation of the **Staybnb – Airbnb Inspired Frontend Website** project:

1. **HTML5 Documentation** – HTML structure and webpage development concepts.
2. **CSS3 Documentation** – Styling, layouts, positioning, and visual design.
3. **MDN Web Docs** – References for HTML, CSS, Flexbox, Media Queries, and responsive web development.
4. **Font Awesome Documentation** – Icons used for navigation and user-interface elements.
5. **Google Maps Documentation** – Embedded map and location-related functionality.
6. **Git Documentation** – Source-code management and version-control concepts.
7. **GitHub Documentation** – Repository management and project hosting.
8. **GitHub Pages Documentation** – Deployment of the frontend website.
9. **Staybnb Project Repository** – Source code, project structure, and implementation reference.
10. **Staybnb Project Documentation** – Project features, development process, and implementation details.
